Hapax Tool: Tool for the installation of decking boards

“With this tool you can effortlessly straighten and tighten the boards of your deck during assembly.”

First aid for warped boards

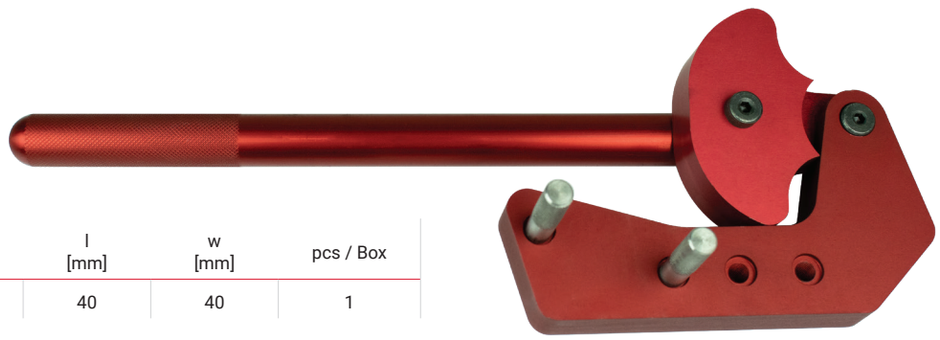

Are your boards slightly warped? Then it is best to use an auxiliary tool to clamp the boards in the correct place. For this you can use our Hapax Tool.

Optimal force transfer

The Hapax Tool can be used to clamp boards. When you apply a force of 20kg to the handle, this results in a force of 85kg.

G-deck: accessory for installing deck screws

“G-deck ensures easy installation and precise alignment of the screws.”

Accurate work with the G-deck

If you opt for a fixing system in which the screws remain visible, you should use the G-deck attachment.

The G-deck attachment ensures that you always maintain the same pre-drilling depth and that you always mount the screws in line.

Adjustable from 90 to 200mm

The attachment is suitable for boards of different widths. This can range from 90 to 200 mm.

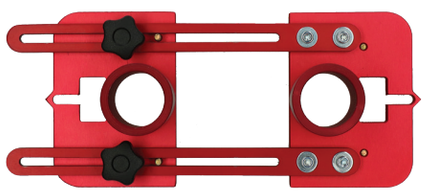

In addition, the countersink drill bit (ø 4mm) that is included ensures that the wood is provided with a countersink space in which the head of the screw fits neatly.

Durability and comfort

The insulation pads in recycled EPDM, a durable material that's weatherproof and does not rot, are suitable for use on a flat surface. They eliminate small differences in the surface and contribute to maintaining the stability and durability of the substructure. In addition, they help to reduce creaking noises and increase walking comfort.

The Hapax spacer: ideal for maintaining the selected joint width

Different joint widths in 1 handy tool

With the handy Hapax spacer you can efficiently maintain the selected joint width between your deck boards. The Hapax spacer allows you to choose a joint width that ranges from a minimum of 4mm to a maximum of 7mm. Each blister pack contains 3 spacers.
